# Critical vs Strategic Minerals

*Critical means you need it; strategic means you don't have it:*

**Critical Mineral** – non-fuel mineral or mineral material essential to the economic and national security of the United States (minerals you need)

**Strategic Mineral** – Essential non-fuel mineral or mineral material for which the United States is heavily reliant on imports (minerals you don't have)

# U.S. Critical Mineral Import Reliance vs Alaska's Potential

Many *critical minerals* needed for economic and national security are supplied by countries with adversarial relationships with the United States

Most of the 34 critical minerals shown on chart are strategic

**Alaska has the potential to supply many of these commodities**

## 2021 U.S. Critical Minerals Import Reliance

## ALASKA

# Q - What is the State of Alaska Doing to Characterize Alaska's Critical Mineral Potential?

- Alaska Division of Geological & Geophysical Surveys (DGGS) has a long-standing program of airborne geophysics combined with large-scale bedrock geological mapping to provide baseline data and geologic context for Alaska's mineral potential
- DGGS' program recently expanded due to a significant increase in funding from the U.S. Geological Survey's Earth Mapping Resources Initiative (USGS Earth MRI)
- Earth MRI base funding - \$10.6M/year nationwide, with an additional \$64M/year from Bipartisan Infrastructure & Jobs Act (5-7-year timeframe for increased funding)
- Partnership between the USGS and state geological surveys throughout U.S.

*Supply chain starts here  
with rocks in the "wild"*

*Need to know where  
look*

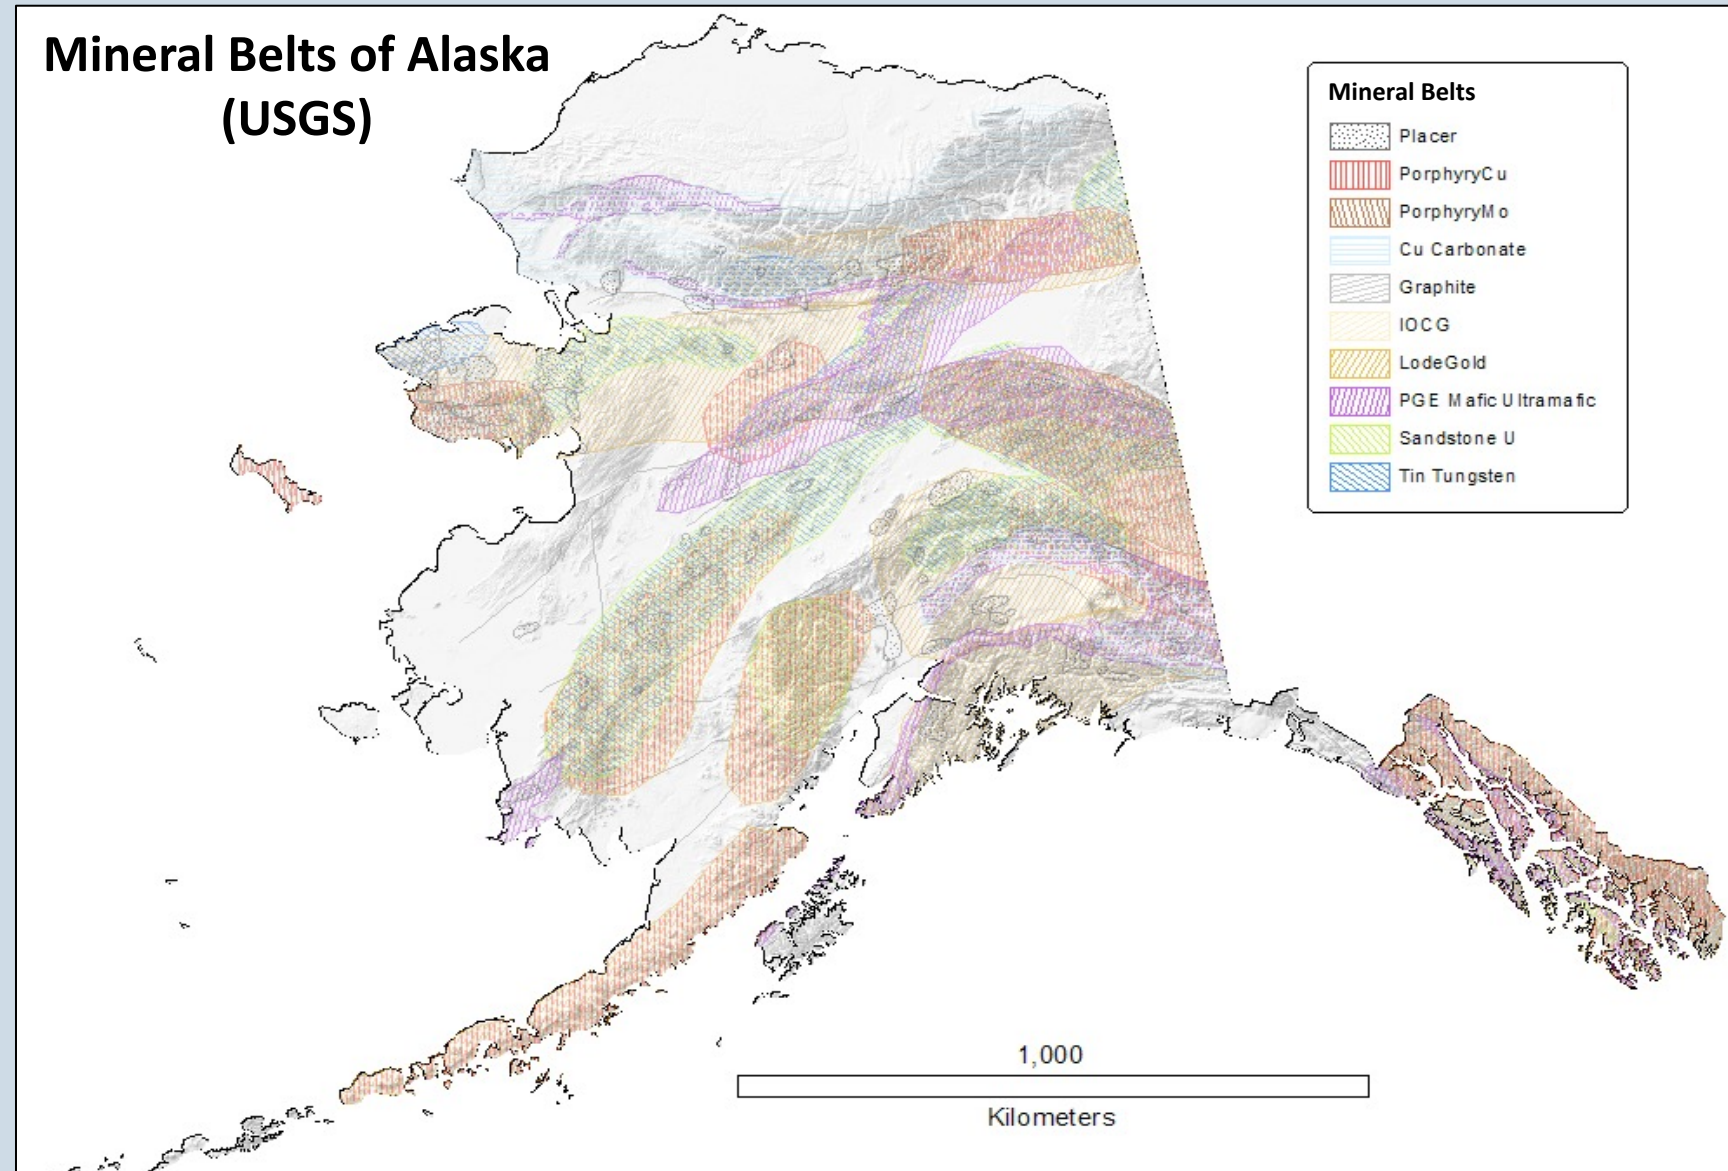

***Geologic maps are essential!***

***A - DGGS has started an effort to systematically map Alaska's high-potential critical mineral belts***

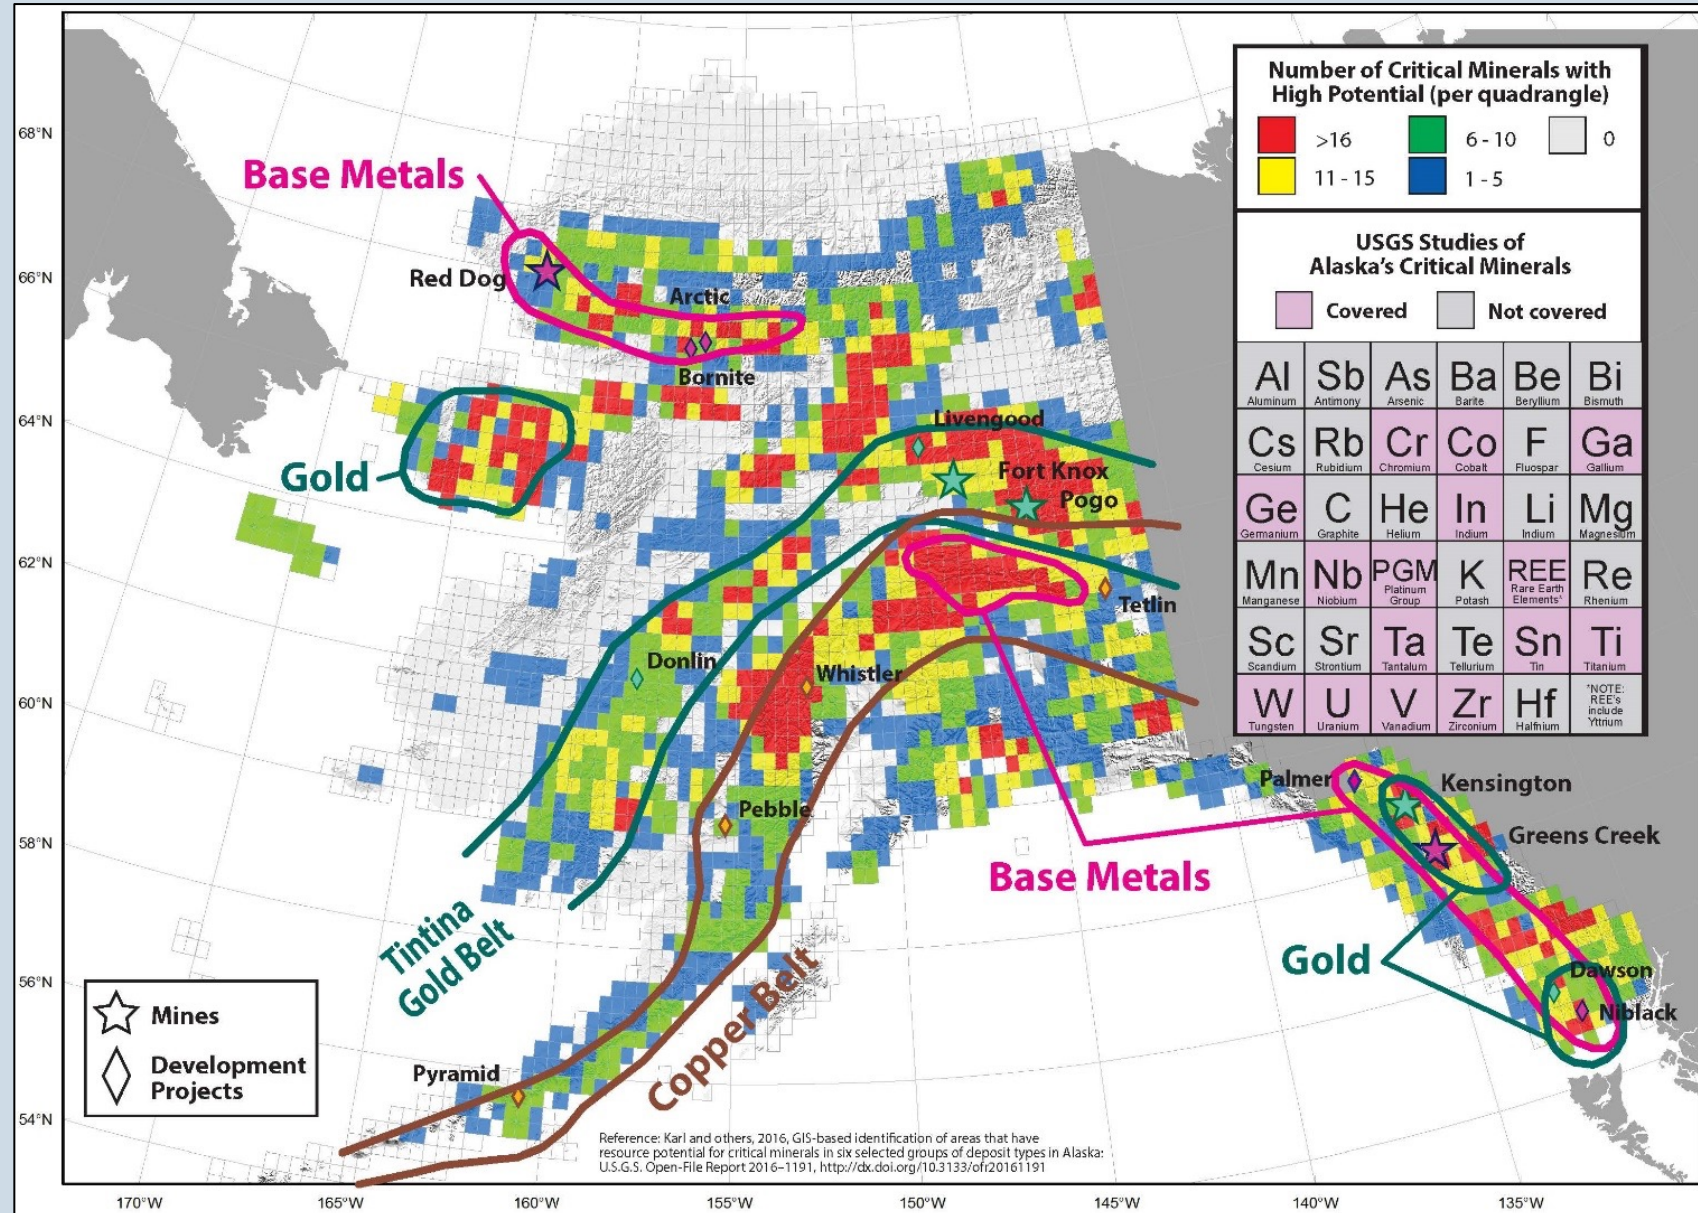

# SOA's Approach to Mapping Alaska's Critical Mineral Areas

- Use available geologic data to ID mineral belts with high-potential
- High-potential belts cover a large part of the state
- While enough information is available to recognize high-potential areas, the high-quality data required by industry for investment decisions are lacking
- To fill data gaps, DGGs prioritizes the areas where multiple potential deposit types overlap

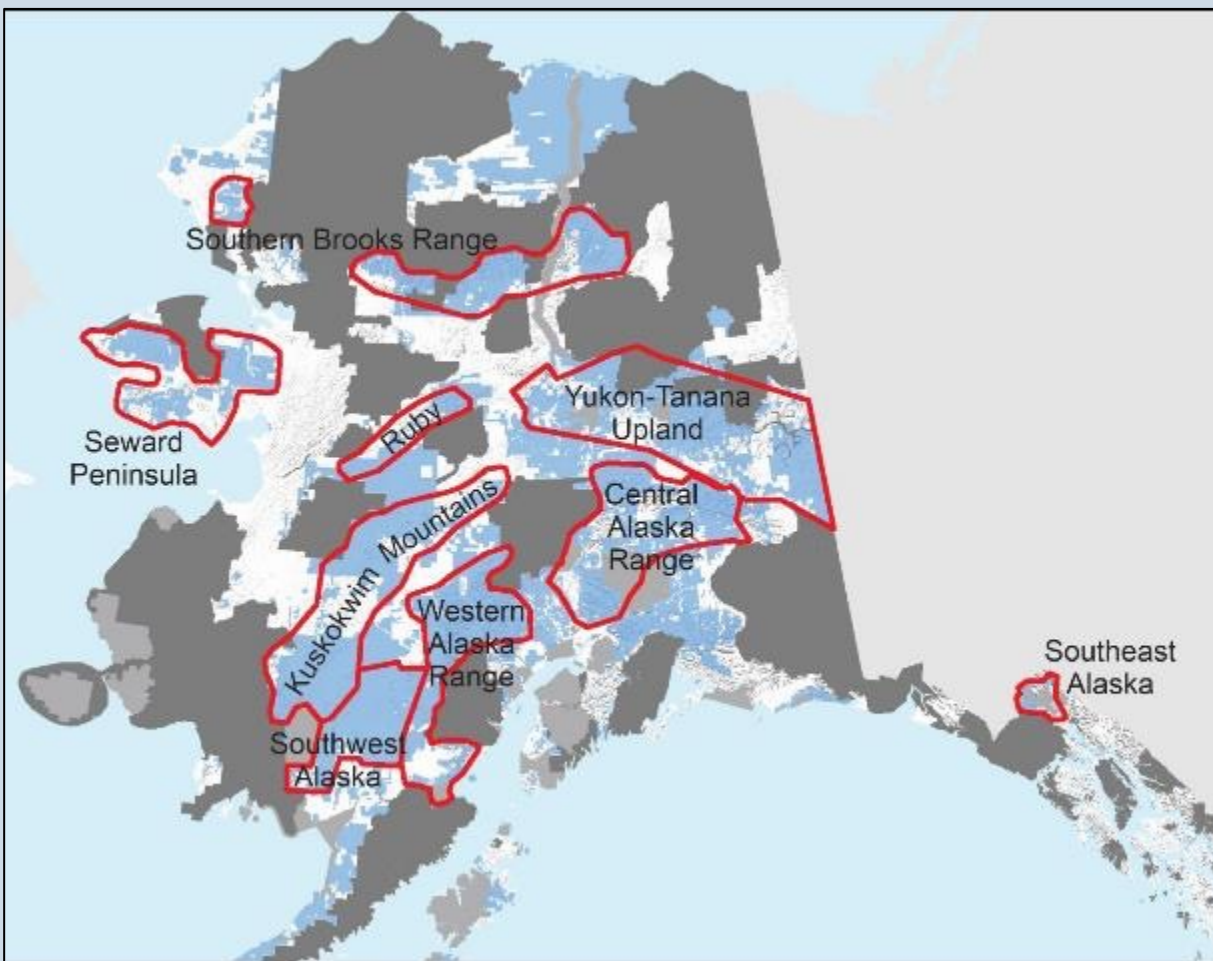

# SOA's Approach to Mapping Alaska's Critical Mineral Areas

Most of Alaska's mineral belts have potential for one or more critical minerals

# SOA's Approach to Mapping Alaska's Critical Mineral Areas

Dark and light gray – Federal and state land, respectively, closed to mineral entry  
 White – Federal and Native lands potentially open to mineral entry  
 Blue – State land open to mineral entry

Data type	High Mineral Potential Area Completeness	Remaining to Complete
Magnetic	33.4%	242,768 sq. km
Radiometric	3.2%	345,113 sq. km
Electromagnetic	15.6%	300,912 sq. km
Geology	32.4%	242,800 sq. km
Geochemistry	16.6%	32,944 samples

- In addition to prioritizing focus areas of greatest overlap, **DGGS focuses on mapping state lands open to mineral entry (blue) within mineral belts (red)**
- To ensure complete coverage of mineral belts DGGS coordinates Earth MRI efforts with USGS MRP-funded research to provide essential context for interpretation and regional synthesis

# Status of Bedrock Geological Mapping in Alaska

- Most of Alaska's mineral belts are mapped at 1:250,000 scale or smaller
- Most of these maps were completed in the 1950s to 1980s and lack detail necessary to guide industry exploration
- Larger-scale maps provide more geological detail necessary for characterizing mineral potential
- 1:100,000 scale bedrock geological maps provide sufficient detail for explorers to assess large areas while limiting mapping costs
- 32% of the state has been mapped at 1:100,000 or larger scale
- Detailed geologic maps and supporting data provide geologic context and help explorers find prospects and make discoveries

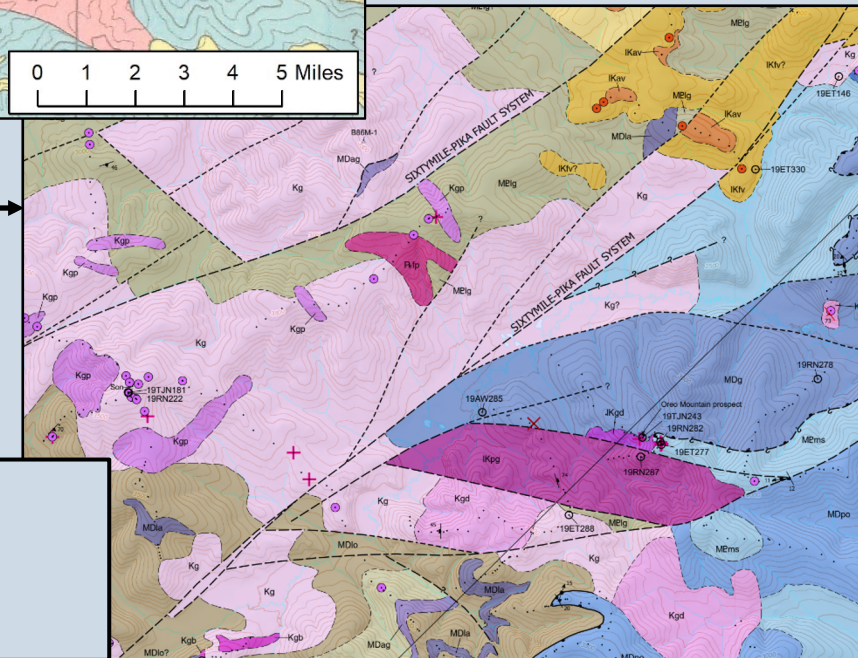

Existing 1960s reconnaissance geological map

*Geologic maps help locate the start of the supply chain*

FFY2019 Earth MRI map of same area

Regional strike-slip fault system  
Two distinct metamorphic terranes  
14 distinct intrusive units

*Twelker and others (2019), Geologic investigations of the Ladue-Mount Fairplay area, eastern Alaska*

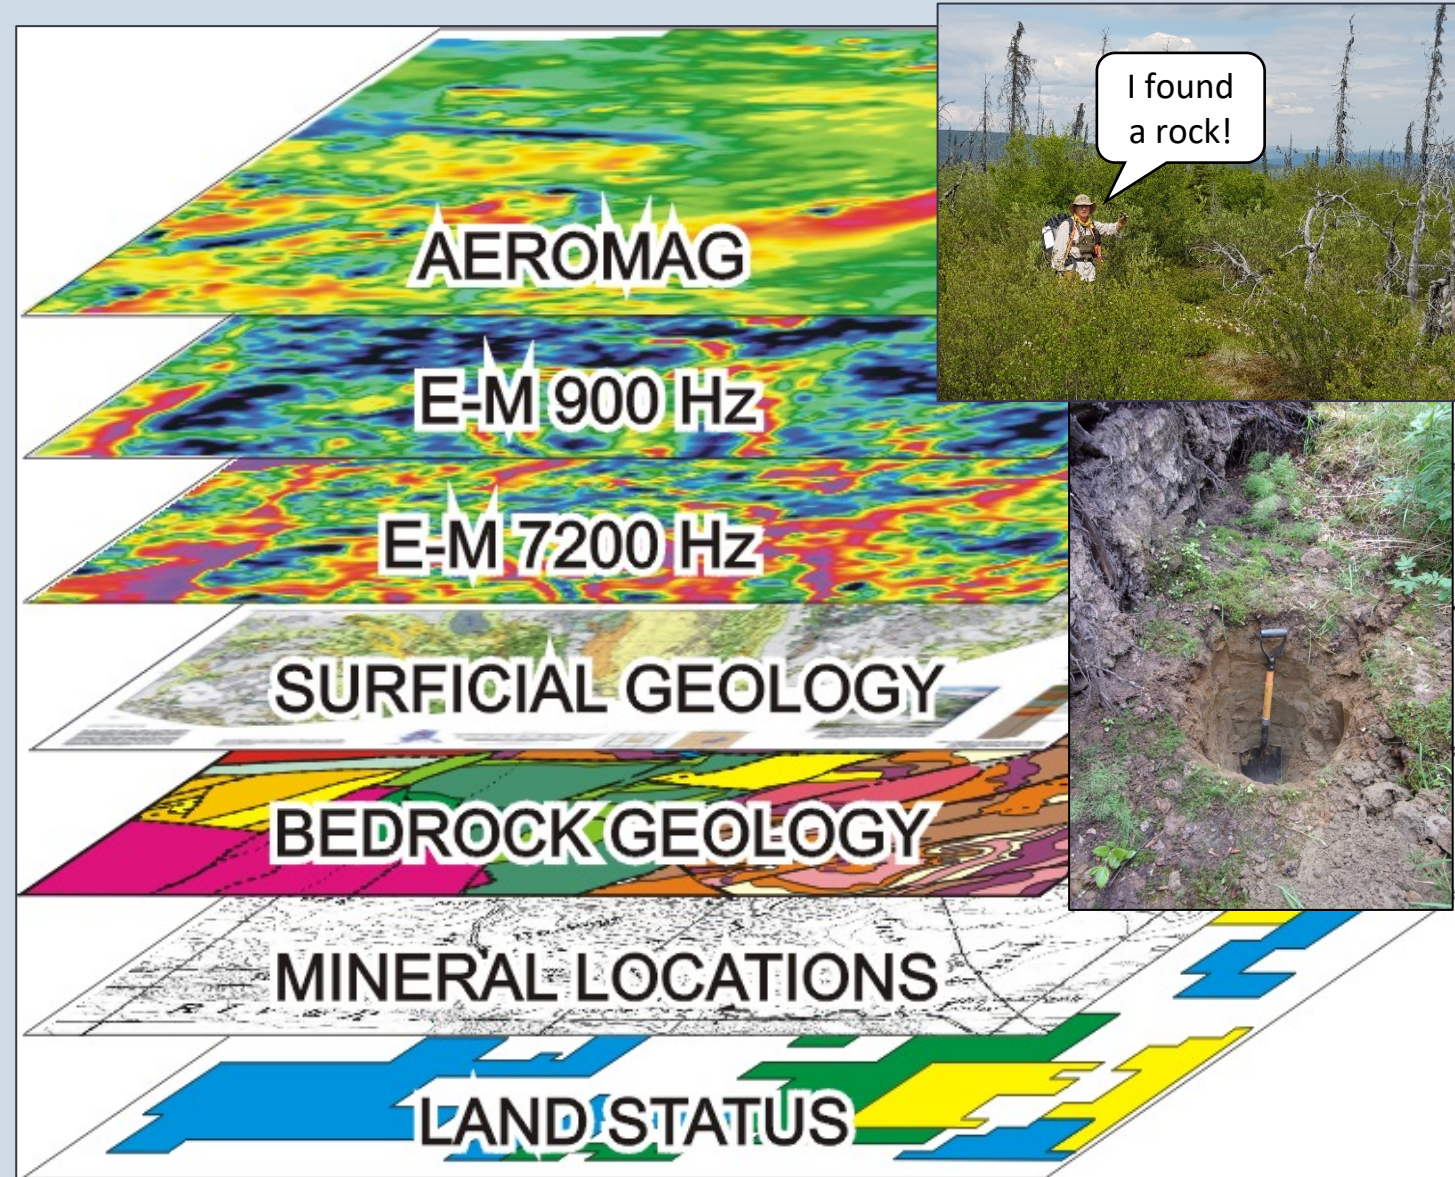

# DGGS Integrated Mapping

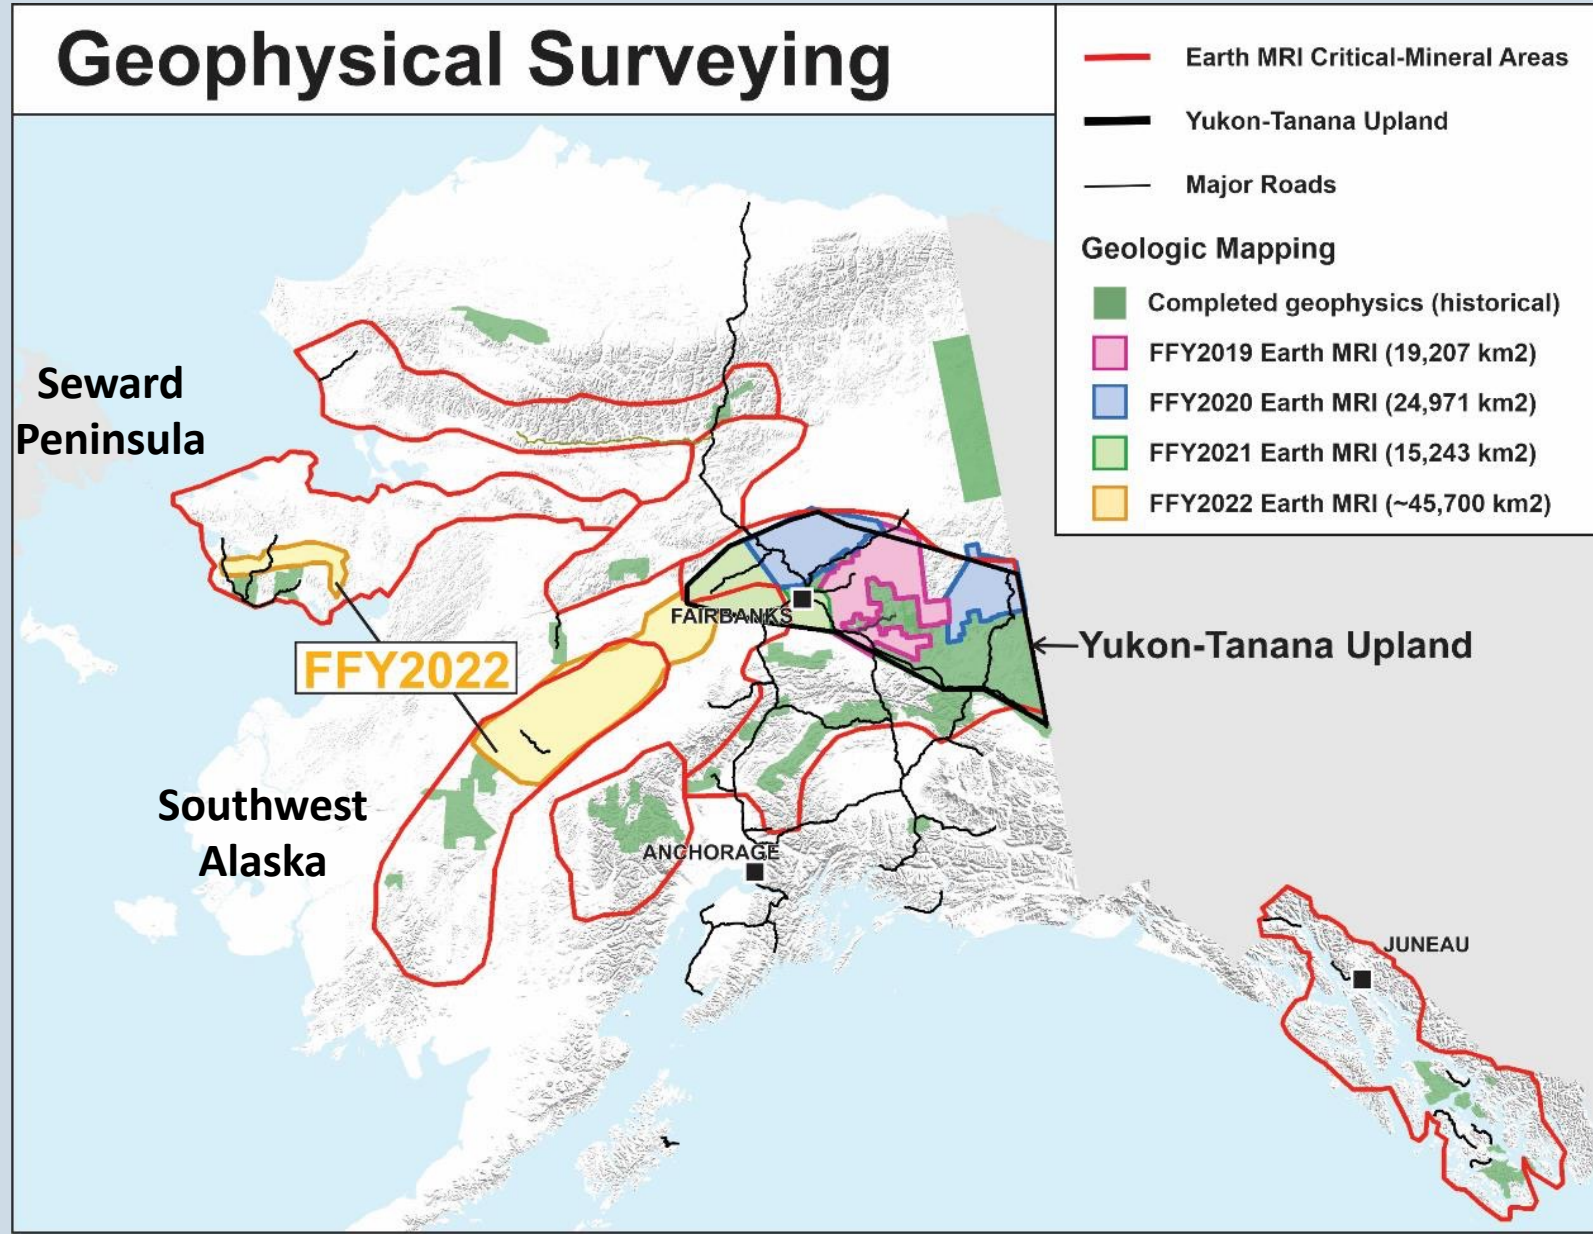

## DGGS takes an integrated approach to geological mapping:

1. In consultation with Geological Mapping Advisory Board, select area to map
2. Acquire airborne geophysics to guide “boots-on-the-ground” geological mapping
3. Deploy field team to map bedrock geology – data collected using pad devices, uploaded to field server, and shared with all field team members
4. Preliminary analysis of rock samples in field for rock ID; samples collected for robust laboratory analyses, age dating etc.
5. Map production using GIS and USGS geological map database schema (GeMS)
6. Publish map and associated data – available for free download from DGGS website (<https://dggs.alaska.gov/>)

# Planned Earth MRI Geophysical Surveying - FFY2022-26

- FFY2022 - Contract electromagnetic survey on Seward Peninsula and magnetic + radiometric survey in Southwest Alaska. Summer 2023
- Expand the State's geophysical-surveying capabilities by hiring 1-2 additional geophysicists
- FFY2023-FFY2026 - Complete surveying of Seward Peninsula and Southwest Alaska regions; start next region
- Extended goal - complete surveying of all of Alaska's critical mineral belts (red outlines) in 10 yrs

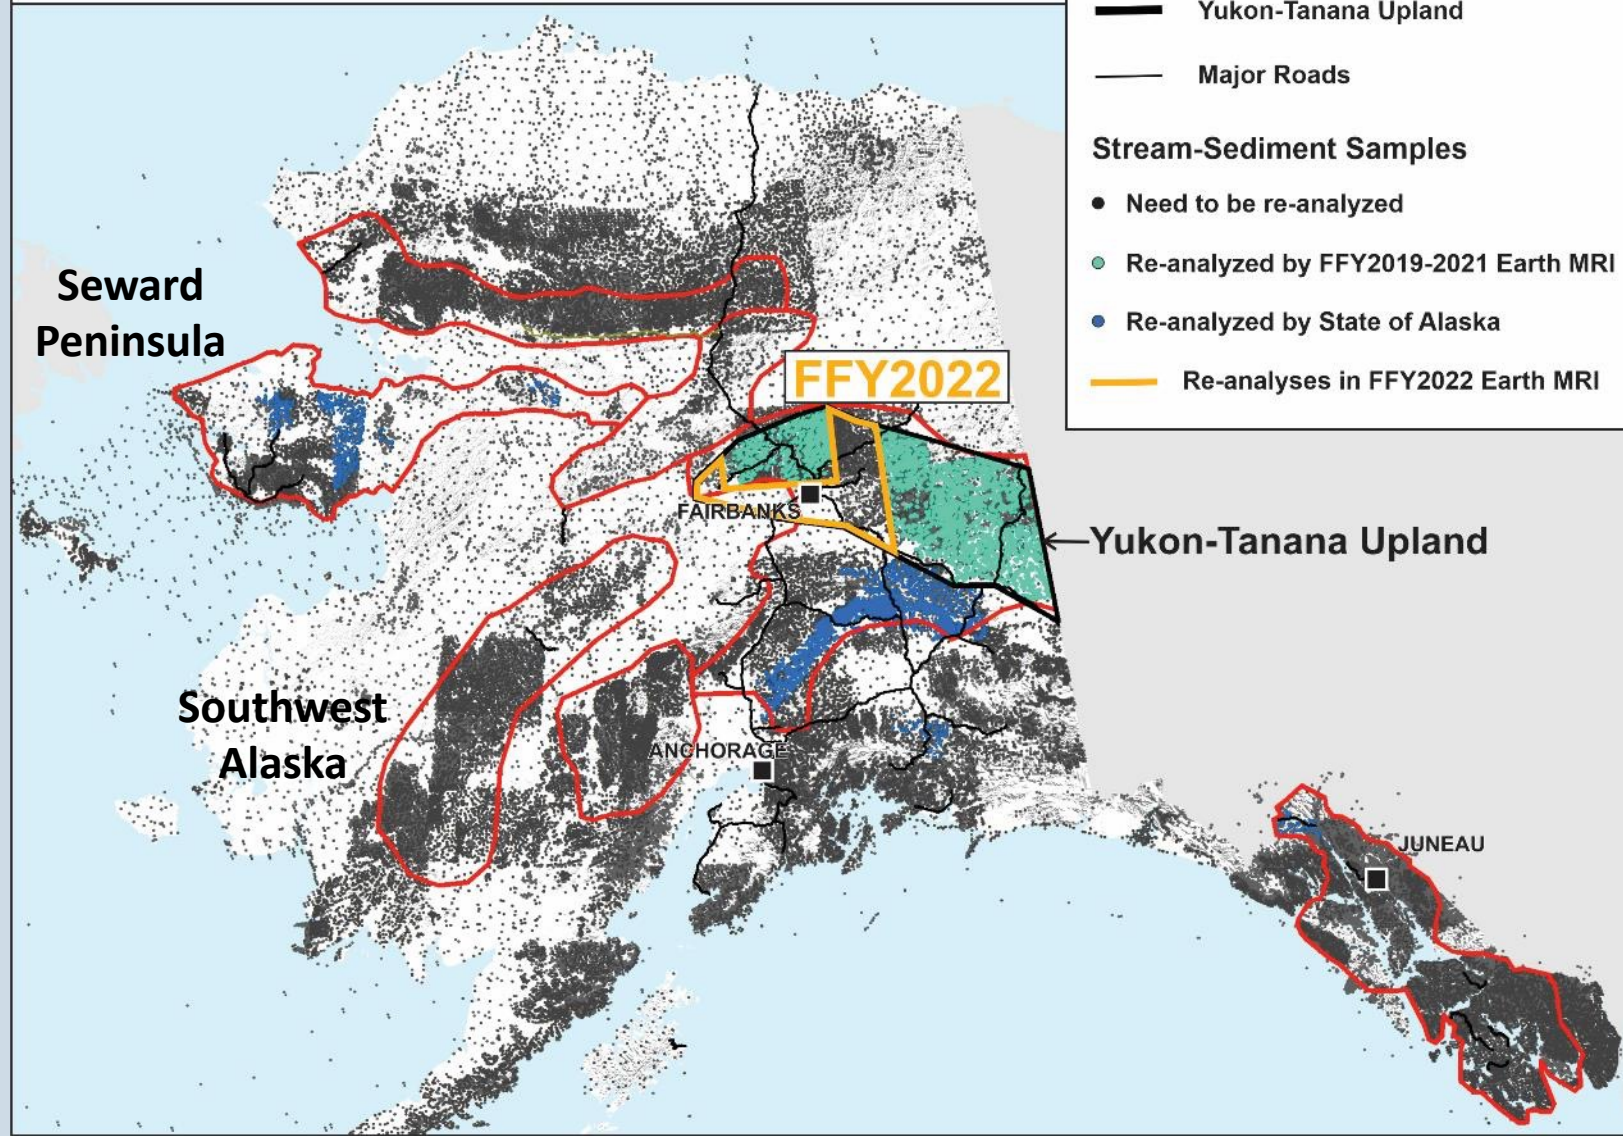

# Planned Geochemical Re-Analyses - FFY2022-26

- New geochemical anomalies can be found by re-analyzing historical stream-sediment samples with modern analytical methods
- Older data is missing elements of interest, has poor detection limits, or used non-quantitative methods.
- FFY2022 – Re-analyze 2,500 additional stream-sediment samples in Yukon-Tanana Upland
- FFY2023-2026 – Re-analyze samples in Southwest Alaska and Seward Peninsula regions
- Goal is to complete geochemical re-analyses of all stream-sediment samples within Alaska’s critical mineral belts (red outlines) – 10 yrs

## Geochemical Re-analyses

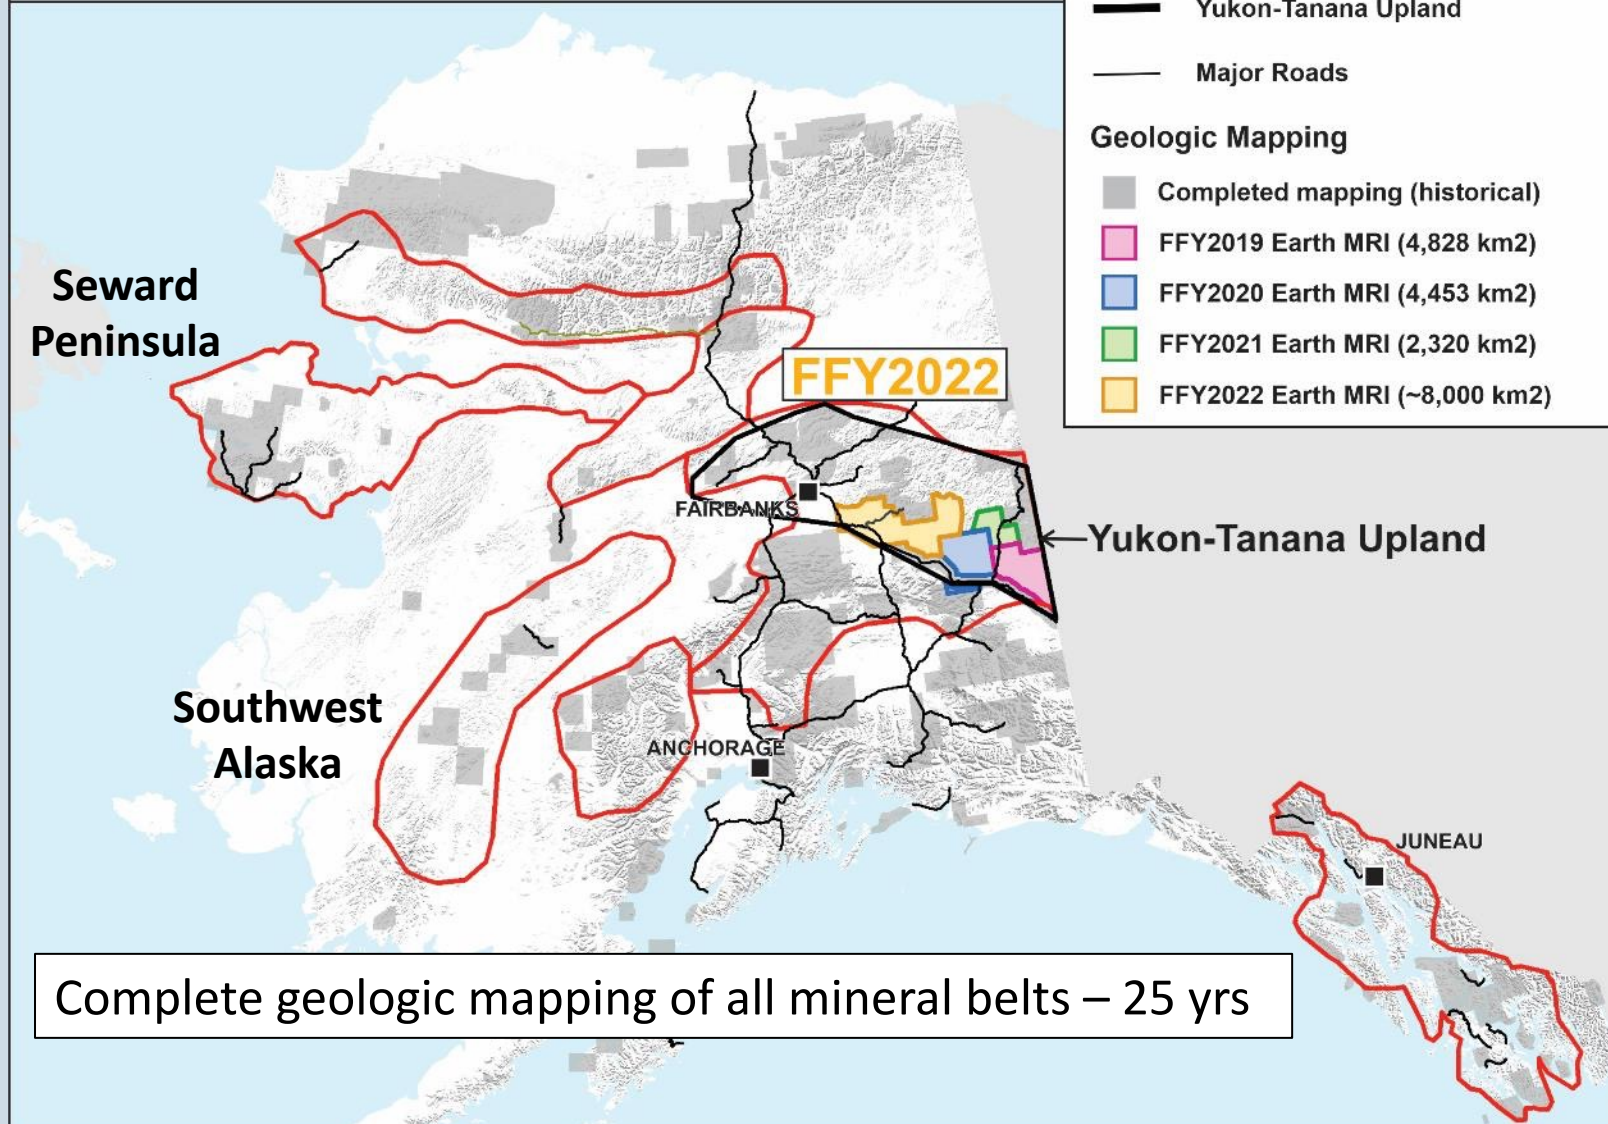

# Planned Earth MRI Geologic Mapping - FFY2022-26

- FFY2022 – Continue geologic mapping in the Yukon-Tanana Upland
- Map ~8,000 square km in Y-T Upland – Summer 2022 (done!)
- Double DGGS’ Mineral Resources geologic mapping team to two teams by FFY2023 (*pending funds*)
- Complete geologic mapping in the Yukon-Tanana Upland by FFY2026, publish geol. map and data, write report summarizing geology and critical-mineral potential
- Extended goal is to move to the Seward Peninsula and Southwest Alaska to start the next phases of geologic mapping

## Geologic Mapping

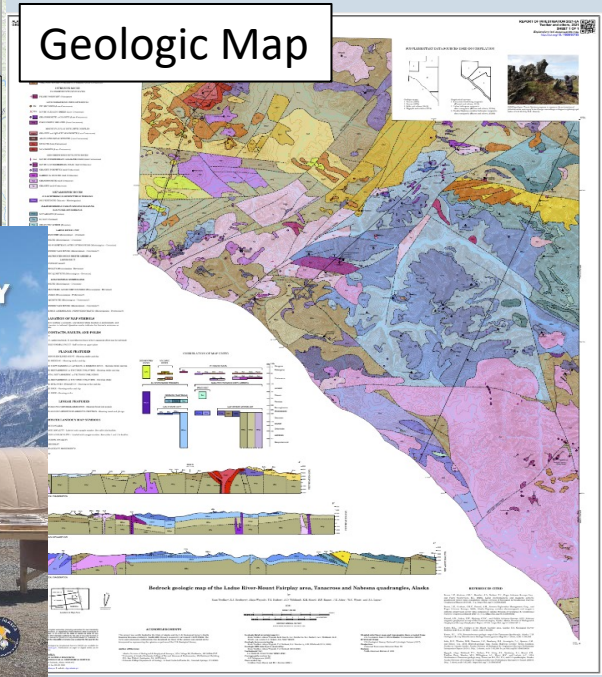

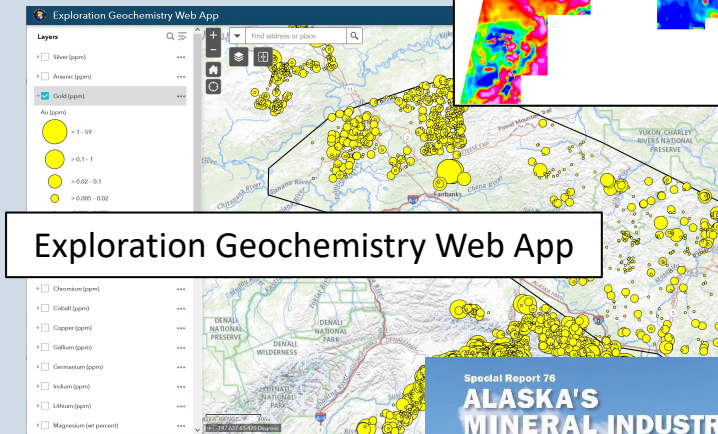

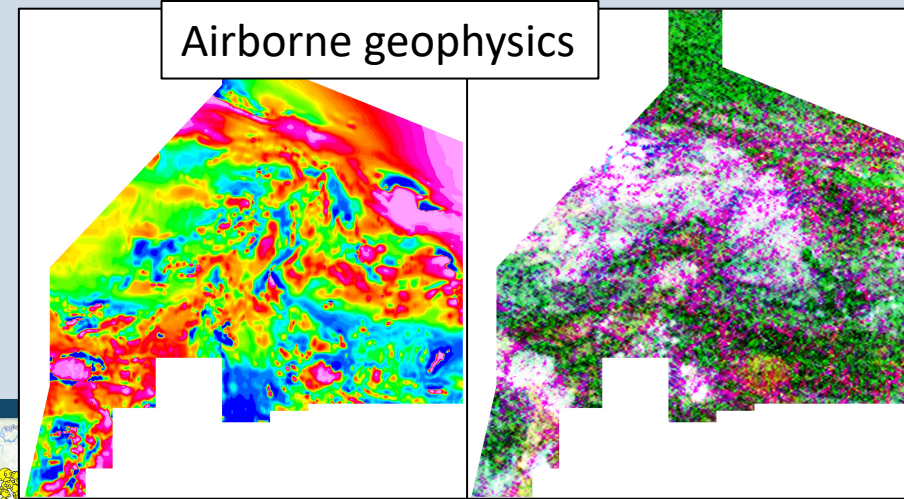

# Products & Publications

- All data served out via DGGS website: <https://dggs.alaska.gov/>
- Alaska Mineral Industry report & database
- Geophysical surveys (published in variety of industry-standard formats)
- Geochemical reports and databases
- Geochronological reports and databases
- Field-station + magnetic susceptibility databases
- Geologic maps:
  - Bedrock + surficial maps
  - Bedrock-only maps (interpret under cover using geophysics)
  - Associated topical interpretive reports (mineral-resource potential, structural history, metamorphism, igneous suites, geochronology, etc.)

# Thank you!
